

In response to CR 733, South Dakota proposes the following data elements for permit transactions:

- General Permit Type Classification - probably good to have when dealing with both OS/OW and other permit types
- Specific Permit Type - nice complement to the general classification to know exactly what kind of permit was issued
- USDOT #
- Issuing State - important when dealing with multiple states - was not initially needed in SD because all communication was within SD.
- PermitID - good to have so more detailed information can be obtained if needed
- Power Unit VIN - good to have so other vehicle checks can be done if needed
- Power Unit License - good to have so other vehicle checks can be done if needed
- Power Unit License State - good to have so other vehicle checks can be done if needed
- Start Date - really needed to know if a permit that was issued is in effect even if the expiration is > than today
- Expiration Date
- Credential Status (pending, active, expired....) - good if concerned about active or voided - otherwise the two dates should be able to represent pending or expired
